POINT-TO-POINT AND GROUND MEASUREMENT

When ordering products these two dimensions are of primary concern. Here are some tips on measuring them correctly. These methods of measurement are valid for all our products.

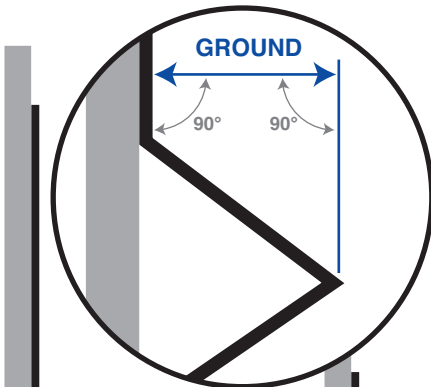

POINT-TO-POINT MEASUREMENT

Point-To-Point is the "Y Dimension" which is the distance from one point to another, measured from the apex (the highest part of something forming a point) of the bend. The simple explanation of apex is the "top of the hill". If you place a straight edge across the points the straight edge will rest on the apex.

POINT-TO-POINT

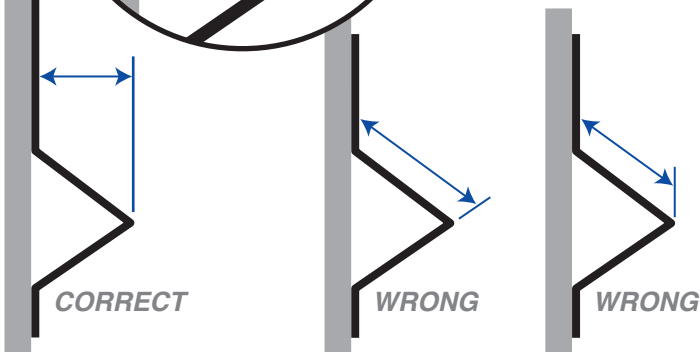

GROUND MEASUREMENT

Also known as outside ground "X Dimension" is the height of the highest point from the ground or base. The measurement is taken straight up/out at a 90° angle from the ground or base.
